Week of March 19th - March 25th			
3/19/2012	Scheduling	2	Found WEBPLANNER, an online software management tool that lets teams creat projects, assign tasks and build a schedule. I set up various tasks and made a tenative schedule.
3/20/2012	Documentation	2.15	Studied AGILE method, wrote a use story
3/21/2012	Domain Research	1	Looked in Qt. Searched for medical imaging and diagnostics. There is very little information about how it works. It is going to be difficult to finish this project with the lack of information available.
3/21/2012	Scheduling	0.5	Added tasks as they became clearer. We still don't have an idea about how to reach the end goal.
3/22/2012	Domain Research	1.5	Excited about CVIP functioning, I looked up functions for various tasks. I'm weary of whether or not we will be able to make it work.
3/24/2012	Domain Research	2	Now that Austin has some CVIP functionality we tested the load image function and edge detection and histogram functions. The problems is that the functions return images, which we need, but we also need values to compare so we are looking for a solution to that issue. We tried using their GUI to see what was happening when they were using those specific functions and, similarly, the result was only an image.
3/24/2012	Scheduling	0.25	Set up a tentative schedule. I am nervous about not getting the API to work again. Although it seems more hopeful than last time, it breaks easily, and so far only works on Austin's computer. If we cannot get it going by Wednesday we may need to find an alternative project.
3/25/2012	Domain Research	0.5	Researched the value of histograms in diagnostics. Tried to find what is normal or abnormal for a brain and was unsuccessful.
	Downloading API and associated software	6	Downloading the actual tools wasn't too time consuming. Once visual studio 2010 was installed it wouldn't build the CVIP files because of a "can't find .lib" error which I googled. Turns out, that error has something to do with backward compatibility of the visual studios so I downloaded an earlier version of CVIP to no avail. Then I spent time "repairing" visual studio. In the meantime I was trying to figure out how to download Qt. I got excited when I found out that it can be integrated with visual studio, since that seems to be the only debugger CVIP is compatible with. So I tried to download Qt and use it, but it didn't work. I'm out in left field right now because nothing works so I can't help Austin write header files or play around with CVIP somemore to discover its functionality.
3/25/2012	Documentation	1	Worked on Project statement and noun extraction.
Total Time Spent		16.9	
Date	Category	Hours	Description
Week of March 26thth - April 1st			
3/27/2012	Research	1.5	Looked at the CVIP book with Austin and started finding functions that may or may not be helpful.
	Installing	0.5	Austin showed me the trick as to how to open CVIPtools.

3/28/2012	Coding	1	Practiced opening images using the input function and played with the histogram feature function. I was mad because I couldn't get it to work.
3/30/2012	Coding	1.5	I spent a lot of time working on implementing the histogram feature function. With numbers we might be able to do some comparison stuff.
	Downloading and installing Qt	2	I had to install all different versions and add-ins of Qt to make it compatible with Visual Studio. I wish there were an easy tutorial or one file, but it's never that easy :)
	Documentation	1.5	Started a formal specification document. It was challenging because I have always used the waterfall method of design and now that we are trying AGILE and it's all iterative I am having a harder time structuring a document. I feel like we don't need one. I also realized we are going to need some sort of help manual. Thanks to Qt and the time I wasted with them.
4/1/2012	Documentation	1	Weekly Log, Organizing Google Docs
	Research	2	Qt, gtests, Putty. I'm super overwhelmed. I need images to play with some of my ideas.
Total Time Spent		11
